

## APPENDIX A

### ATSDR MINIMAL RISK LEVEL AND WORKSHEETS

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) [42 U.S.C. 9601 et seq.], as amended by the Superfund Amendments and Reauthorization Act (SARA) [Pub. L. 99–499], requires that the Agency for Toxic Substances and Disease Registry (ATSDR) develop jointly with the U.S. Environmental Protection Agency (EPA), in order of priority, a list of hazardous substances most commonly found at facilities on the CERCLA National Priorities List (NPL); prepare toxicological profiles for each substance included on the priority list of hazardous substances; and assure the initiation of a research program to fill identified data needs associated with the substances.

The toxicological profiles include an examination, summary, and interpretation of available toxicological information and epidemiologic evaluations of a hazardous substance. During the development of toxicological profiles, Minimal Risk Levels (MRLs) are derived when reliable and sufficient data exist to identify the target organ(s) of effect or the most sensitive health effect(s) for a specific duration for a given route of exposure. An MRL is an estimate of the daily human exposure to a hazardous substance that is likely to be without appreciable risk of adverse noncancer health effects over a specified duration of exposure. MRLs are based on noncancer health effects only and are not based on a consideration of cancer effects. These substance-specific estimates, which are intended to serve as screening levels, are used by ATSDR health assessors to identify contaminants and potential health effects that may be of concern at hazardous waste sites. It is important to note that MRLs are not intended to define clean-up or action levels.

MRLs are derived for hazardous substances using the no-observed-adverse-effect level/uncertainty factor approach. They are below levels that might cause adverse health effects in the people most sensitive to such chemical-induced effects. MRLs are derived for acute (1–14 days), intermediate (15–364 days), and chronic (365 days and longer) durations and for the oral and inhalation routes of exposure. Currently, MRLs for the dermal route of exposure are not derived because ATSDR has not yet identified a method suitable for this route of exposure. MRLs are generally based on the most sensitive chemical-induced end point considered to be of relevance to humans. Serious health effects (such as irreparable damage to the liver or kidneys, or birth defects) are not used as a basis for establishing MRLs. Exposure to a level above the MRL does not mean that adverse health effects will occur.

MRLs are intended only to serve as a screening tool to help public health professionals decide where to look more closely. They may also be viewed as a mechanism to identify those hazardous waste sites that are not expected to cause adverse health effects. Most MRLs contain a degree of uncertainty because of the lack of precise toxicological information on the people who might be most sensitive (e.g., infants, elderly, nutritionally or immunologically compromised) to the effects of hazardous substances. ATSDR

## APPENDIX A

uses a conservative (i.e., protective) approach to address this uncertainty consistent with the public health principle of prevention. Although human data are preferred, MRLs often must be based on animal studies because relevant human studies are lacking. In the absence of evidence to the contrary, ATSDR assumes that humans are more sensitive to the effects of hazardous substance than animals and that certain persons may be particularly sensitive. Thus, the resulting MRL may be as much as a hundredfold below levels that have been shown to be nontoxic in laboratory animals.

Proposed MRLs undergo a rigorous review process: Health Effects/MRL Workgroup reviews within the Division of Toxicology, expert panel peer reviews, and agencywide MRL Workgroup reviews, with participation from other federal agencies and comments from the public. They are subject to change as new information becomes available concomitant with updating the toxicological profiles. Thus, MRLs in the most recent toxicological profiles supersede previously published levels. For additional information regarding MRLs, please contact the Division of Toxicology, Agency for Toxic Substances and Disease Registry, 1600 Clifton Road, Mailstop E-29, Atlanta, Georgia 30333.

## APPENDIX A

**MINIMAL RISK LEVEL (MRL) WORKSHEET**

Chemical Name: Fluorine  
CAS Number: 7782-41-4  
Date: July 20, 2001  
Profile Status: Third Draft  
Route: ☒ Inhalation ☐ Oral  
Duration: ☒ Acute ☐ Intermediate ☐ Chronic  
Key to Figure: 9  
Species: Humans

Minimal Risk Level: 0.01 ☐ mg/kg/day ☒ ppm

Reference: Keplinger ML, Suissa LW. 1968. Toxicity of fluorine short-term inhalation. Am Ind Hyg Assoc J 29(1):10-18.

Experimental design (human study details or strain, number of animals per exposure/control groups, sex, dose administration details): Five volunteers (aged 19–50 years; gender not specified) were exposed to various concentrations of fluorine: 10 ppm for 3, 5, or 15 minutes; 23 ppm for 3–5-minute periods every 15 minutes for 2–3 hours, 50 ppm for 3 minutes, 67 ppm for 1 minute, 78 ppm for 1 minute, and 100 ppm for 0.5 or 1 minute. No information was provided on the amount of time between exposures or whether all subjects were exposed to all concentrations.

Effects noted in study and corresponding concentrations: No nasal, eye, or skin irritation were reported at 10 ppm. Eye, nasal, and skin irritation were reported at doses of 50, 67, or 78 ppm, respectively; the severity of the irritation was concentration-related. Exposure to 100 ppm was considered very irritating and the subjects did not inhale during the exposure period. No incidence data were reported.

Concentration and end point used for MRL derivation: The MRL is based on a NOAEL of 10 ppm fluorine for no irritation.

☒ NOAEL ☐ LOAEL

Uncertainty Factors used in MRL derivation:

- ☐ 10 for use of a LOAEL
- ☐ 10 for extrapolation from animals to humans
- ☒ 10 for human variability

Was a conversion factor used from ppm in food or water to a mg/body weight dose? No

If an inhalation study in animals, list conversion factors used in determining human equivalent concentration: NA

Was a conversion used from intermittent to continuous exposure? Yes. The NOAEL of 10 ppm fluorine for 15 minutes was adjusted for intermittent exposure using the following equation:

$$10 \text{ ppm} \times 0.25 \text{ hours}/24 \text{ hours} = 0.1 \text{ ppm}$$

## APPENDIX A

Other additional studies or pertinent information that lend support to this MRL: Respiratory effects have also been observed in rats, mice, guinea pigs, rabbits, and dogs exposed to fluorine for 1–60 minutes (Keplinger and Suissa 1968). The observed effects include diffuse lung congestion, dyspnea, irritation, and alveolar necrosis and hemorrhage. The severity of the lung congestion was concentration-related and no species differences were found.

Agency Contact (Chemical Manager): Carolyn Tylanda, D.M.D., Ph.D.

## APPENDIX A

**MINIMAL RISK LEVEL (MRL) WORKSHEET**

Chemical Name: Hydrogen Fluoride  
 CAS Number: 7664-39-3  
 Date: August 22, 2001  
 Profile Status: Fourth Draft  
 Route: ☒ Inhalation ☐ Oral  
 Duration: ☒ Acute ☐ Intermediate ☐ Chronic  
 Key to Figure: 9  
 Species: Rats

Minimal Risk Level: 0.03 ☐ mg/kg/day ☒ ppm

Reference: Rosenholtz MJ, Carson TR, Weeks MH, et al. 1963. A toxicopathologic study in animals after brief single exposures to hydrogen fluoride. Am Ind Hyg Assoc J 24:253-261.

Experimental design (human study details or strain, number of animals per exposure/control groups, sex, dose administration details): Groups of 15–20 male Wistar rats were exposed to 0, 98, 120, 276, or 465 ppm fluoride as hydrogen fluoride for 60 minutes.

Effects noted in study and corresponding concentrations: At the lowest concentration (98 ppm), occasional pawing at the nose and blinking of the eyes were reported; this concentration was considered a NOAEL. At 120 ppm, general discomfort, pawing at the nose, and tearing from the eyes were observed. Exposure to 465 ppm fluoride, produced respiratory distress lasting a few hours after exposure termination, as well as lacrimation, nasal discharge, and reddened conjunctivae. Animals appeared depressed and weak for 24 hours and sluggish for an additional day.

Concentration and end point used for MRL derivation: The MRL is based on a NOAEL of 98 ppm fluoride as hydrogen fluoride for nasal irritation.

☒ NOAEL ☐ LOAEL

Uncertainty Factors used in MRL derivation:

<input type="checkbox"/>	10 for use of a LOAEL
<input checked="" type="checkbox"/>	3 for extrapolation from animals to humans with dosimetric adjustments
<input checked="" type="checkbox"/>	10 for human variability

Was a conversion factor used from ppm in food or water to a mg/body weight dose? No

If an inhalation study in animals, list conversion factors used in determining human equivalent concentration:

Extrathoracic surface area in rats and humans: 15 and 200 cm<sup>2</sup>, respectively  
 Inhalation rate in Wistar rats and humans: 0.42 and 20 m<sup>3</sup>/day, respectively

The NOAEL<sub>HEC</sub> was calculated using the following equation:

$$98 \text{ ppm} \times [(0.43 \text{ m}^3/\text{day} / 15 \text{ cm}^2) / (20 \text{ m}^3/\text{day} / 200 \text{ cm}^2)] = 27 \text{ ppm}$$

Was a conversion used from intermittent to continuous exposure? Yes. The NOAEL<sub>HEC</sub> of 27 ppm for 60 minutes was adjusted for intermittent exposure using the following equation:

$$27 \text{ ppm} \times 1 \text{ hour}/24 \text{ hours} = 1 \text{ ppm}$$

## APPENDIX A

Other additional studies or pertinent information that lend support to this MRL:

Nasal irritation was also observed in rats exposed to higher concentrations of hydrogen fluoride for shorter durations (Rosenholtz et al. 1963). Respiratory distress was observed in rats exposed to 50% of the LC<sub>50</sub> value for 5, 15, 30, or 60 minutes (2,310, 1,339, 1,308, and 465 ppm fluoride, respectively) (Rosenholtz et al. 1963). Dalbey et al. (1998a, 1998b) reported midtracheal necrosis in rats exposed to 902 or 1,509 ppm fluoride as hydrogen fluoride for 2 or 10 minutes using a mouth breathing model with a tracheal cannula. These effects were not observed when the tracheal cannula was not used.

Agency Contact (Chemical Manager): Carolyn Tylanda, D.M.D., Ph.D.

## APPENDIX A

**MINIMAL RISK LEVEL (MRL) WORKSHEET**

Chemical Name: Hydrogen fluoride  
CAS Number: 7664-39-3  
Date: July 20, 2001  
Profile Status: Third Draft  
Route: ☒ Inhalation ☐ Oral  
Duration: ☐ Acute ☒ Intermediate ☐ Chronic  
Key to Figure: 14  
Species: Humans

Minimal Risk Level: 0.02 ☐ mg/kg/day ☒ ppm

Reference: Largent EJ. 1960. The metabolism of fluorides in man. AMA Archives of Industrial Health 21:318-323.

Experimental design (human study details or strain, number of animals per exposure/control groups, sex, dose administration details): Five volunteers (aged 19–50 years; gender not specified) were exposed to various concentrations of hydrogen fluoride. The ranges (and mean concentrations) for each subject were 0.85–1.9 ppm fluoride (1.3 ppm fluoride) for 15 days, 1.8–4.6 ppm fluoride (3.2 ppm fluoride) for 30 days, 2.9–7.5 ppm fluoride (2.6 ppm fluoride) for 25 days, 2.6–7.7 ppm fluoride (4.0 ppm fluoride) for 50 days, and 1.7–4.9 ppm fluoride (2.4 ppm fluoride) for 25 days. The mean of the average concentrations was 2.98 ppm fluoride.

Effects noted in study and corresponding concentrations: The study authors noted that each of the subjects reported “discomfort in the form of slight stinging sensation in the skin, eyes, and some slight irritation of the nasal passages”. The irritation was more severe at higher concentrations. No other information was provided.

Concentration and end point used for MRL derivation: The MRL is based on a LOAEL of 2.98 ppm for slight nasal irritation.

☐ NOAEL ☒ LOAEL

Uncertainty Factors used in MRL derivation:

☒ 3 for use of a LOAEL  
☐ 10 for extrapolation from animals to humans  
☒ 10 for human variability

Was a conversion factor used from ppm in food or water to a mg/body weight dose? No

If an inhalation study in animals, list conversion factors used in determining human equivalent concentration: NA

Was a conversion used from intermittent to continuous exposure? Yes. The LOAEL of 2.98 ppm was adjusted for intermittent exposure using the following equation:

$$2.98 \text{ ppm fluoride} \times 6 \text{ hours}/24 \text{ hours.}$$

An assumption was made that the volunteers were exposed to hydrogen fluoride daily.

Other additional studies or pertinent information that lend support to this MRL: A number of human and animal studies support the identification of respiratory irritation as the critical effect following inhalation exposure to hydrogen fluoride. Respiratory tract irritation (throat burning and sore throat, shortness of

## APPENDIX A

breath, cough) and decreased lung function were observed in residents accidentally exposed to hydrogen fluoride (Wing et al. 1991). Respiratory effects have also been reported in animal studies. In animal studies, impaired lung function and necrosis and inflammation of the ventral meatus, nasal septum, and nasoturbinates (Dalbey et al. 1998a, 1998b) were observed following acute inhalation exposure to hydrogen fluoride. Pulmonary hemorrhage and hyperplasia of the bronchial epithelium were observed in laboratory animals exposed to 18 ppm fluoride as hydrogen fluoride for 30–35 days (Machle and Kitzmiller 1935; Stokinger 1949).

Agency Contact (Chemical Manager): Carolyn Tylanda, D.M.D., Ph.D.

## APPENDIX A

**MINIMAL RISK LEVEL (MRL) WORKSHEET**

Chemical Name: Fluoride  
CAS Number: NA  
Date: July 20, 2001  
Profile Status: Third Draft  
Route: ☐ Inhalation ☒ Oral  
Duration: ☐ Acute ☐ Intermediate ☒ Chronic  
Key to Figure: 41  
Species: Humans

Minimal Risk Level: 0.06 ☒ mg/kg/day ☐ mg/m<sup>3</sup>

Reference: Riggs BL, Hodgson SF, O'Fallon WH, et al. 1990. Effect of fluoride treatment on the fracture rate in postmenopausal women with osteoporosis. N Engl J Med 322:802-809.

Riggs BL, O'Fallon WH, Lane A, et al. 1994. Clinical trial of fluoride therapy in postmenopausal osteoporotic women: extended observations and additional analysis. J Bone Mineral Res 9:265-275.

Experimental design (human study details or strain, number of animals per exposure/control groups, sex, dose administration details): A prospective, randomized, double-blind, placebo-controlled study of 202 women with postmenopausal osteoporosis ascertained the effect of administering 34 mg fluoride/day as sodium fluoride. Both groups received 1,500 mg calcium/day. Rigorous criteria excluded patients with metabolic diseases. A total of 135 patients (66 in the treatment group and 69 in the control group) completed the full 4 years of treatment. The Riggs et al. (1994) followed 50 of the subjects in the fluoride group for an additional 2 years.

Effects noted in study and corresponding concentrations: Bone mineral density in the lumbar spine, femoral neck, and femoral trochanter increased markedly in the treatment group, but bone mineral density in the shaft of the radius decreased by 4%. There was no significant difference in the number of new vertebral fractures between the treatment and control groups, although the number of vertebral fractures in the fluoride group was slightly elevated in the first year. In contrast, the level of nonvertebral fractures in the fluoride group was 3.2 times that of the control group, with significant increases in both the frequency and the rate of fractures. Most of the increase was due to increased incidences of incomplete ("stress") fractures, which occurred 16.8 times more often in the treatment group. In the subjects followed for the additional 2 years, the incidence of vertebral fractures and nonvertebral fractures decreased. The overall occurrence of nonvertebral fractures for years 0–6 was still 3 times higher than in the control group (years 0–4).

Concentration and end point used for MRL derivation:

The MRL is based on a LOAEL of 0.56 mg fluoride/kg/day for increased fracture rate.

☐ NOAEL ☒ LOAEL

Uncertainty Factors used in MRL derivation:

- ☒ 10 for use of a LOAEL in a sensitive subpopulation
- ☐ 10 for extrapolation from animals to humans
- ☐ 10 for human variability

Was a conversion factor used from ppm in food or water to a mg/body weight dose? No

If an inhalation study in animals, list conversion factors used in determining human equivalent concentration: NA

## APPENDIX A

Was a conversion used from intermittent to continuous exposure? NA

Other additional studies or pertinent information that lend support to this MRL: A parallel study was carried out with identical protocols, except that all of the women participated in a supervised exercise program (Kleerekoper et al. 1989). There was no significant difference between the treatment and control groups in vertebral fracture rate or annual height loss. This study was only reported as an abstract and has not been followed up in the literature. In a smaller version of the Riggs et al. (1990) study, osteoporotic women who received 22.6 mg fluoride/day as sodium fluoride with either calcitriol or calcium had an increased incidence of hip fractures compared to osteoporotic women who received placebo or calcitriol only (Hedlund and Gallagher 1989).

A number of studies have examined the effect on bone fracture rate in communities with high levels of fluoride in the drinking water (Cooper et al. 1990, 1991; Danielson et al. 1992; Goggin et al. 1965; Simonen and Laitinen 1985; Sowers et al. 1991). The weight of evidence from these experiments suggests that fluoride added to water can increase the risk of hip fracture in both elderly women and men. However, questions remain due to issues such as the lack of information on trends in hip fracture incidence and total individual fluoride consumption.

Agency Contact (Chemical Manager): Carolyn Tylanda, D.M.D., Ph.D.

## APPENDIX B

### USER'S GUIDE

#### Chapter 1

##### Public Health Statement

This chapter of the profile is a health effects summary written in non-technical language. Its intended audience is the general public especially people living in the vicinity of a hazardous waste site or chemical release. If the Public Health Statement were removed from the rest of the document, it would still communicate to the lay public essential information about the chemical.

The major headings in the Public Health Statement are useful to find specific topics of concern. The topics are written in a question and answer format. The answer to each question includes a sentence that will direct the reader to chapters in the profile that will provide more information on the given topic.

#### Chapter 2

##### Relevance to Public Health

This chapter provides a health effects summary based on evaluations of existing toxicologic, epidemiologic, and toxicokinetic information. This summary is designed to present interpretive, weight-of-evidence discussions for human health end points by addressing the following questions.

1. What effects are known to occur in humans?
2. What effects observed in animals are likely to be of concern to humans?
3. What exposure conditions are likely to be of concern to humans, especially around hazardous waste sites?

The chapter covers end points in the same order they appear within the Discussion of Health Effects by Route of Exposure section, by route (inhalation, oral, dermal) and within route by effect. Human data are presented first, then animal data. Both are organized by duration (acute, intermediate, chronic). *In vitro* data and data from parenteral routes (intramuscular, intravenous, subcutaneous, etc.) are also considered in this chapter. If data are located in the scientific literature, a table of genotoxicity information is included.

The carcinogenic potential of the profiled substance is qualitatively evaluated, when appropriate, using existing toxicokinetic, genotoxic, and carcinogenic data. ATSDR does not currently assess cancer potency or perform cancer risk assessments. Minimal risk levels (MRLs) for noncancer end points (if derived) and the end points from which they were derived are indicated and discussed.

Limitations to existing scientific literature that prevent a satisfactory evaluation of the relevance to public health are identified in the Chapter 3 Data Needs section.

##### Interpretation of Minimal Risk Levels

## APPENDIX B

Where sufficient toxicologic information is available, we have derived minimal risk levels (MRLs) for inhalation and oral routes of entry at each duration of exposure (acute, intermediate, and chronic). These MRLs are not meant to support regulatory action; but to acquaint health professionals with exposure levels at which adverse health effects are not expected to occur in humans. They should help physicians and public health officials determine the safety of a community living near a chemical emission, given the concentration of a contaminant in air or the estimated daily dose in water. MRLs are based largely on toxicological studies in animals and on reports of human occupational exposure.

MRL users should be familiar with the toxicologic information on which the number is based. Chapter 2, "Relevance to Public Health," contains basic information known about the substance. Other sections such as Chapter 3 Section 3.9, "Interactions with Other Substances," and Section 3.10, "Populations that are Unusually Susceptible" provide important supplemental information.

MRL users should also understand the MRL derivation methodology. MRLs are derived using a modified version of the risk assessment methodology the Environmental Protection Agency (EPA) provides (Barnes and Dourson 1988) to determine reference doses for lifetime exposure (RfDs).

To derive an MRL, ATSDR generally selects the most sensitive end point which, in its best judgement, represents the most sensitive human health effect for a given exposure route and duration. ATSDR cannot make this judgement or derive an MRL unless information (quantitative or qualitative) is available for all potential systemic, neurological, and developmental effects. If this information and reliable quantitative data on the chosen end point are available, ATSDR derives an MRL using the most sensitive species (when information from multiple species is available) with the highest NOAEL that does not exceed any adverse effect levels. When a NOAEL is not available, a lowest-observed-adverse-effect level (LOAEL) can be used to derive an MRL, and an uncertainty factor (UF) of 10 must be employed. Additional uncertainty factors of 10 must be used both for human variability to protect sensitive subpopulations (people who are most susceptible to the health effects caused by the substance) and for interspecies variability (extrapolation from animals to humans). In deriving an MRL, these individual uncertainty factors are multiplied together. The product is then divided into the inhalation concentration or oral dosage selected from the study. Uncertainty factors used in developing a substance-specific MRL are provided in the footnotes of the LSE Tables.

## Chapter 3

### Health Effects

#### Tables and Figures for Levels of Significant Exposure (LSE)

Tables (3-1, 3-2, and 3-3) and figures (3-1 and 3-2) are used to summarize health effects and illustrate graphically levels of exposure associated with those effects. These levels cover health effects observed at increasing dose concentrations and durations, differences in response by species, minimal risk levels (MRLs) to humans for noncancer end points, and EPA's estimated range associated with an upper-bound individual lifetime cancer risk of 1 in 10,000 to 1 in 10,000,000. Use the LSE tables and figures for a quick review of the health effects and to locate data for a specific exposure scenario. The LSE tables and figures should always be used in conjunction with the text. All entries in these tables and figures represent studies that provide reliable, quantitative estimates of No-Observed-Adverse-Effect Levels (NOAELs), Lowest-Observed-Adverse-Effect Levels (LOAELs), or Cancer Effect Levels (CELs).

## APPENDIX B

The legends presented below demonstrate the application of these tables and figures. Representative examples of LSE Table 3-1 and Figure 3-1 are shown. The numbers in the left column of the legends correspond to the numbers in the example table and figure.

**LEGEND****See LSE Table 3-1**

- (1) Route of Exposure One of the first considerations when reviewing the toxicity of a substance using these tables and figures should be the relevant and appropriate route of exposure. When sufficient data exists, three LSE tables and two LSE figures are presented in the document. The three LSE tables present data on the three principal routes of exposure, i.e., inhalation, oral, and dermal (LSE Table 3-1, 3-2, and 3-3, respectively). LSE figures are limited to the inhalation (LSE Figure 3-1) and oral (LSE Figure 3-2) routes. Not all substances will have data on each route of exposure and will not therefore have all five of the tables and figures.
- (2) Exposure Period Three exposure periods - acute (less than 15 days), intermediate (15–364 days), and chronic (365 days or more) are presented within each relevant route of exposure. In this example, an inhalation study of intermediate exposure duration is reported. For quick reference to health effects occurring from a known length of exposure, locate the applicable exposure period within the LSE table and figure.
- (3) Health Effect The major categories of health effects included in LSE tables and figures are death, systemic, immunological, neurological, developmental, reproductive, and cancer. NOAELs and LOAELs can be reported in the tables and figures for all effects but cancer. Systemic effects are further defined in the "System" column of the LSE table (see key number 18).
- (4) Key to Figure Each key number in the LSE table links study information to one or more data points using the same key number in the corresponding LSE figure. In this example, the study represented by key number 18 has been used to derive a NOAEL and a Less Serious LOAEL (also see the 2 "18r" data points in Figure 3-1).
- (5) Species The test species, whether animal or human, are identified in this column. Chapter 2, "Relevance to Public Health," covers the relevance of animal data to human toxicity and Section 3.4, "Toxicokinetics," contains any available information on comparative toxicokinetics. Although NOAELs and LOAELs are species specific, the levels are extrapolated to equivalent human doses to derive an MRL.
- (6) Exposure Frequency/Duration The duration of the study and the weekly and daily exposure regimen are provided in this column. This permits comparison of NOAELs and LOAELs from different studies. In this case (key number 18), rats were exposed to 1,1,2,2-tetrachloroethane via inhalation for 6 hours per day, 5 days per week, for 3 weeks. For a more complete review of the dosing regimen refer to the appropriate sections of the text or the original reference paper, i.e., Nitschke et al. 1981.
- (7) System This column further defines the systemic effects. These systems include: respiratory, cardiovascular, gastrointestinal, hematological, musculoskeletal, hepatic, renal, and dermal/ocular. "Other" refers to any systemic effect (e.g., a decrease in body weight) not covered in these systems. In the example of key number 18, 1 systemic effect (respiratory) was investigated.

## APPENDIX B

- (8) NOAEL A No-Observed-Adverse-Effect Level (NOAEL) is the highest exposure level at which no harmful effects were seen in the organ system studied. Key number 18 reports a NOAEL of 3 ppm for the respiratory system which was used to derive an intermediate exposure, inhalation MRL of 0.005 ppm (see footnote "b").
- (9) LOAEL A Lowest-Observed-Adverse-Effect Level (LOAEL) is the lowest dose used in the study that caused a harmful health effect. LOAELs have been classified into "Less Serious" and "Serious" effects. These distinctions help readers identify the levels of exposure at which adverse health effects first appear and the gradation of effects with increasing dose. A brief description of the specific end point used to quantify the adverse effect accompanies the LOAEL. The respiratory effect reported in key number 18 (hyperplasia) is a Less serious LOAEL of 10 ppm. MRLs are not derived from Serious LOAELs.
- (10) Reference The complete reference citation is given in Chapter 9 of the profile.
- (11) CEL A Cancer Effect Level (CEL) is the lowest exposure level associated with the onset of carcinogenesis in experimental or epidemiologic studies. CELs are always considered serious effects. The LSE tables and figures do not contain NOAELs for cancer, but the text may report doses not causing measurable cancer increases.
- (12) Footnotes Explanations of abbreviations or reference notes for data in the LSE tables are found in the footnotes. Footnote "b" indicates the NOAEL of 3 ppm in key number 18 was used to derive an MRL of 0.005 ppm.

**LEGEND****See Figure 3-1**

LSE figures graphically illustrate the data presented in the corresponding LSE tables. Figures help the reader quickly compare health effects according to exposure concentrations for particular exposure periods.

- (13) Exposure Period The same exposure periods appear as in the LSE table. In this example, health effects observed within the intermediate and chronic exposure periods are illustrated.
- (14) Health Effect These are the categories of health effects for which reliable quantitative data exists. The same health effects appear in the LSE table.
- (15) Levels of Exposure concentrations or doses for each health effect in the LSE tables are graphically displayed in the LSE figures. Exposure concentration or dose is measured on the log scale "y" axis. Inhalation exposure is reported in mg/m<sup>3</sup> or ppm and oral exposure is reported in mg/kg/day.
- (16) NOAEL In this example, 18r NOAEL is the critical end point for which an intermediate inhalation exposure MRL is based. As you can see from the LSE figure key, the open-circle symbol indicates to a NOAEL for the test species-rat. The key number 18 corresponds to the entry in the LSE table. The dashed descending arrow indicates the extrapolation from the exposure level of 3 ppm (see entry 18 in the Table) to the MRL of 0.005 ppm (see footnote "b" in the LSE table).
- (17) CEL Key number 38r is 1 of 3 studies for which Cancer Effect Levels were derived. The diamond symbol refers to a Cancer Effect Level for the test species-mouse. The number 38 corresponds to the entry in the LSE table.

## APPENDIX B

- (18) Estimated Upper-Bound Human Cancer Risk Levels This is the range associated with the upper-bound for lifetime cancer risk of 1 in 10,000 to 1 in 10,000,000. These risk levels are derived from the EPA's Human Health Assessment Group's upper-bound estimates of the slope of the cancer dose response curve at low dose levels ( $q_1^*$ ).
- (19) Key to LSE Figure The Key explains the abbreviations and symbols used in the figure.

# SAMPLE

## APPENDIX C

### ACRONYMS, ABBREVIATIONS, AND SYMBOLS

ACGIH	American Conference of Governmental Industrial Hygienists
ADI	Acceptable Daily Intake
ADME	Absorption, Distribution, Metabolism, and Excretion
AFID	alkali flame ionization detector
AFOSH	Air Force Office of Safety and Health
AML	acute myeloid leukemia
AOAC	Association of Official Analytical Chemists
atm	atmosphere
ATSDR	Agency for Toxic Substances and Disease Registry
AWQC	Ambient Water Quality Criteria
BAT	Best Available Technology
BCF	bioconcentration factor
BEI	Biological Exposure Index
BSC	Board of Scientific Counselors
C	Centigrade
CAA	Clean Air Act
CAG	Cancer Assessment Group of the U.S. Environmental Protection Agency
CAS	Chemical Abstract Services
CDC	Centers for Disease Control and Prevention
CEL	Cancer Effect Level
CELDS	Computer-Environmental Legislative Data System
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CFR	Code of Federal Regulations
Ci	curie
CL	ceiling limit value
CLP	Contract Laboratory Program
cm	centimeter
CML	chronic myeloid leukemia
CNS	central nervous system
CPSC	Consumer Products Safety Commission
CWA	Clean Water Act
d	day
Derm	dermal
DHEW	Department of Health, Education, and Welfare
DHHS	Department of Health and Human Services
DNA	deoxyribonucleic acid
DOD	Department of Defense
DOE	Department of Energy
DOL	Department of Labor
DOT	Department of Transportation
DOT/UN/	Department of Transportation/United Nations/
NA/IMCO	North America/International Maritime Dangerous Goods Code
DWEL	Drinking Water Exposure Level
ECD	electron capture detection
ECG/EKG	electrocardiogram
EEG	electroencephalogram

## APPENDIX C

EEGL	Emergency Exposure Guidance Level
EPA	Environmental Protection Agency
F	Fahrenheit
F <sub>1</sub>	first-filial generation
FAO	Food and Agricultural Organization of the United Nations
FDA	Food and Drug Administration
FEMA	Federal Emergency Management Agency
FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act
FPD	flame photometric detection
fpm	feet per minute
ft	foot
FR	<i>Federal Register</i>
g	gram
GC	gas chromatography
Gd	gestational day
gen	generation
GLC	gas liquid chromatography
GPC	gel permeation chromatography
HPLC	high-performance liquid chromatography
hr	hour
HRGC	high resolution gas chromatography
HSDB	Hazardous Substance Data Bank
IDLH	Immediately Dangerous to Life and Health
IARC	International Agency for Research on Cancer
ILO	International Labor Organization
in	inch
IRIS	Integrated Risk Information System
K <sub>d</sub>	adsorption ratio
kg	kilogram
kkg	metric ton
K <sub>oc</sub>	organic carbon partition coefficient
K <sub>ow</sub>	octanol-water partition coefficient
L	liter
LC	liquid chromatography
LC <sub>Lo</sub>	lethal concentration, low
LC <sub>50</sub>	lethal concentration, 50% kill
LD <sub>Lo</sub>	lethal dose, low
LD <sub>50</sub>	lethal dose, 50% kill
LT <sub>50</sub>	lethal time, 50% kill
LOAEL	lowest-observed-adverse-effect level
LSE	Levels of Significant Exposure
m	meter
MA	<i>trans,trans</i> -muconic acid
MAL	Maximum Allowable Level
mCi	millicurie
MCL	Maximum Contaminant Level
MCLG	Maximum Contaminant Level Goal
mg	milligram
min	minute
mL	milliliter

## APPENDIX C

mm	millimeter
mm Hg	millimeters of mercury
mmol	millimole
mo	month
mppcf	millions of particles per cubic foot
MRL	Minimal Risk Level
MS	mass spectrometry
NAAQS	National Ambient Air Quality Standard
NAS	National Academy of Science
NATICH	National Air Toxics Information Clearinghouse
NATO	North Atlantic Treaty Organization
NCE	normochromatic erythrocytes
NCI	National Cancer Institute
NIEHS	National Institute of Environmental Health Sciences
NIOSH	National Institute for Occupational Safety and Health
NIOSHTIC	NIOSH's Computerized Information Retrieval System
NFPA	National Fire Protection Association
ng	nanogram
NLM	National Library of Medicine
nm	nanometer
NHANES	National Health and Nutrition Examination Survey
nmol	nanomole
NOAEL	no-observed-adverse-effect level
NOES	National Occupational Exposure Survey
NOHS	National Occupational Hazard Survey
NPD	nitrogen phosphorus detection
NPDES	National Pollutant Discharge Elimination System
NPL	National Priorities List
NR	not reported
NRC	National Research Council
NS	not specified
NSPS	New Source Performance Standards
NTIS	National Technical Information Service
NTP	National Toxicology Program
ODW	Office of Drinking Water, EPA
OERR	Office of Emergency and Remedial Response, EPA
OHM/TADS	Oil and Hazardous Materials/Technical Assistance Data System
OPP	Office of Pesticide Programs, EPA
OPPTS	Office of Prevention, Pesticides and Toxic Substances, EPA
OPPT	Office of Pollution Prevention and Toxics, EPA
OSHA	Occupational Safety and Health Administration
OSW	Office of Solid Waste, EPA
OTS	Office of Toxic Substances
OW	Office of Water
OWRS	Office of Water Regulations and Standards, EPA
PAH	Polycyclic Aromatic Hydrocarbon
PBPD	Physiologically Based Pharmacodynamic
PBPK	Physiologically Based Pharmacokinetic
PCE	polychromatic erythrocytes
PEL	permissible exposure limit

## APPENDIX C

PID	photo ionization detector
pg	picogram
pmol	picomole
PHS	Public Health Service
PMR	proportionate mortality ratio
ppb	parts per billion
ppm	parts per million
ppt	parts per trillion
PSNS	Pretreatment Standards for New Sources
REL	recommended exposure level/limit
RfC	Reference Concentration
RfD	Reference Dose
RNA	ribonucleic acid
RTECS	Registry of Toxic Effects of Chemical Substances
RQ	Reportable Quantity
SARA	Superfund Amendments and Reauthorization Act
SCE	sister chromatid exchange
sec	second
SIC	Standard Industrial Classification
SIM	selected ion monitoring
SMCL	Secondary Maximum Contaminant Level
SMR	standard mortality ratio
SNARL	Suggested No Adverse Response Level
SPEGL	Short-Term Public Emergency Guidance Level
STEL	short term exposure limit
STORET	Storage and Retrieval
TD <sub>50</sub>	toxic dose, 50% specific toxic effect
TLV	threshold limit value
TOC	Total Organic Compound
TPQ	Threshold Planning Quantity
TRI	Toxics Release Inventory
TSCA	Toxic Substances Control Act
TRI	Toxics Release Inventory
TWA	time-weighted average
U.S.	United States
UF	uncertainty factor
VOC	Volatile Organic Compound
yr	year
WHO	World Health Organization
wk	week
>	greater than
≥	greater than or equal to
=	equal to
<	less than
≤	less than or equal to
%	percent
α	alpha
β	beta
γ	gamma

## APPENDIX C

$\delta$	delta
$\mu\text{m}$	micrometer
$\mu\text{g}$	microgram
$q_1^*$	cancer slope factor
–	negative
+	positive
(+)	weakly positive result
(–)	weakly negative result

## APPENDIX D

## INDEX

acute dermal exposure	103, 152, 153, 158
acute inhalation exposure	16, 19, 21, 31, 48, 118, 158
ambient air	50, 189, 195, 206, 207, 215, 219
Arctic	191
bioaccumulation	206
bioavailability	98, 99, 101, 144, 146, 197, 206
biomagnify	206
biomarker	139-141, 158, 220
birds	156
body weight effects	56, 90, 103
breast milk	139, 198, 199, 208
cancer	7, 8, 9, 16, 17, 27, 58, 59, 96-98, 100, 113, 137, 152, 154, 155, 164, 232
carcinogen	155, 232
carcinogenic	16, 27, 59, 96, 100, 155
carcinogenicity	9, 16-18, 59, 96, 97, 101, 155, 224, 227, 232
cardiovascular effects	16, 50, 76, 103, 104, 152
cholinesterase	91
chronic inhalation exposure	28, 31, 154
Department of Health and Human Services	7, 18
dermal effects	56, 104-106
DHHS	17, 18, 60, 80, 133, 138, 142, 154, 158, 185
DNA	114-116, 139, 155
dog	51, 94, 160
endocrine effects	56, 89
FDA	11, 101, 195, 226, 227, 232
fetus	94, 119, 120, 137, 138
Food and Drug Administration	5, 11, 12, 18, 101, 232
fruits	15, 177, 194, 198, 226
gastrointestinal effects	17, 19, 50, 51, 77-79, 152
general population	10, 15, 58, 139, 177, 195, 207
grass	187, 218
half-life	117, 124, 139, 187
hematological effects	51, 79
Henry's law	165, 166
hepatic effects	54, 88, 104
hydrolysis	187, 188, 216
immune system	91, 157
immunological effects	57
insects	247
Integrated Risk Information System	232
iodine	2, 163
IQ	95, 138, 156
kidney	7, 21, 31, 56, 61, 89, 123, 125, 128, 131, 143, 154, 159
kidney effects	21
Krishnan and Andersen 1994	130
LD50	61, 62
liver	17, 21, 31, 54, 55, 61, 88, 99, 100, 104, 115, 121, 123-125, 131, 132, 139,
lung	19, 21, 47-49, 58, 59, 62, 78, 81, 122, 123, 131, 139
lung cancer	58, 59
lymph	105, 124
lymphoreticular effects	57, 90, 113
milk	77, 94, 139, 144, 145, 177, 187, 193, 198-200, 208, 216
Minimal Risk Level	21
MRL	21-24, 153, 154, 223
mullet	186
musculoskeletal effects	52, 54, 80, 87
National Priorities List	1, 175
neurobehavioral	136
neurodevelopmental	138, 161
NIOSH	12, 164, 197, 211-217, 219-221, 225, 232
NOAEL	21-23, 27, 31, 62, 94, 103, 106, 112, 223
NOES	197

## APPENDIX D

NPL	1, 175, 176, 178, 184-186, 209
ocular effects	19, 56, 62, 102, 106, 112, 152
oxidative phosphorylation	126
paresthesia	91
partition coefficients	165
PBPD	130
PBPK	129-132
pharmacodynamic	129, 130
pharmacokinetic	129, 130, 132, 153, 154
precipitation	3, 145, 175, 177, 184-186, 188, 191
Public health	1, 7, 11, 12, 15, 18, 25, 27, 90, 136, 148, 152, 205, 208, 211, 220, 230
RCRA	178
reference dose	223, 232
regulations	11, 12, 18, 184, 223-225, 232
renal effects	16, 55, 89, 104, 117
reportable quantity	228
reproductive system	156,
Resource Conservation and Recovery Act	178
RfD	223, 232
Safe Drinking Water Act	18
salmon	260
sea	177, 178, 188
sediment	3, 175, 178, 186, 188, 192, 206
sedimentation	188
selenium	139, 259, 282, 288
shrimp	186
soil	3, 4, 10, 12, 15, 82, 175, 177, 178, 184-189, 191-193, 205-208
solubility	165, 199
sputum	50
Standardized mortality ratio	58
Superfund	1
surface water	4, 175, 178, 185, 186, 190, 191, 207, 209
swallow	5, 6, 11
T3	89
thyroid	23, 89, 99, 136
thyroid stimulating hormone	89, 136
thyroxine	89, 136
time-weighted average	53, 56, 232
toxicokinetic	25, 117, 139, 161, 162
Toxics Release Inventory	168
TRI	168, 174, 178, 181, 182, 184-186, 206
triiodothyronine	89, 136
tumors	98, 101
TWA	53, 224, 225, 229, 232
vapor phase	175, 194
vapor pressure	165
volatilization	211
